Dear Tina,

Everyone in our industry knows that, even at it's best, the raw output from a CMM is confusing to those unfamiliar with its format. This is very frustrating to the CMM programmer who has to make the output palatable. It usually involves transcribing the output to an AIAG Dimensional results Form. This is a long, tedious and costly waste of resources.

PPAP has taken the pain out of this process. Following a few simple rules in the programming stage can save hours of transcription. The results are clear, concise and, best of all, easily understood.

As a corporation we are only beginning to understand the vast potential for this software, but we expect, in the near future, to be utilizing it to its full potential.
